

RackSEAL Airflow Solutions

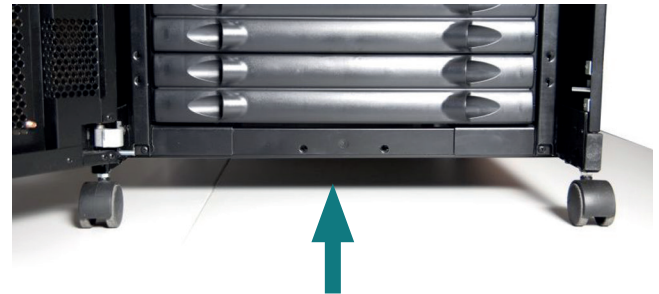

Airflow Management For Racks & Floors

RackSEAL

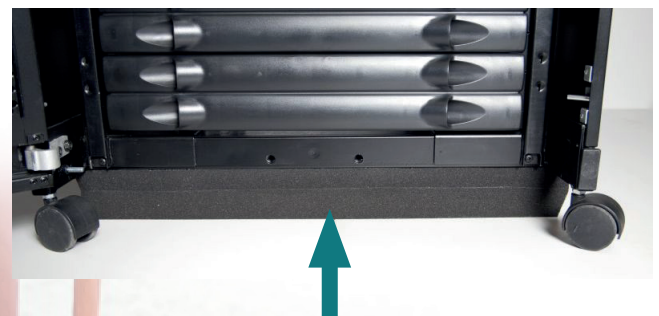

Part of airflow management best practice is managing gaps in IT racks and raised floors; and sealing them.

As part of an airflow strategy this can lead to cooling cost savings in data centres or IT rooms. RackSEAL solutions can help with this airflow management.

- RackSEAL foam tape is a self adhesive air barrier.
- Prevents hot air circulating back to the front of racks between cabinet sides and rails, between racks or underneath the rack.
- Reduces hot spots caused by exhaust air.
- Slow expansion allows RackSEAL Air Barrier to be installed without disturbing cables.
- Seals around cables passing from the front to back of the rack.
- Available in two widths of 25mm and 40mm (expanded widths 48mm and 120mm respectively).
- RackSEAL Floor is a 600mm x 600mm foam sheet perforated into 25mm x 25mm sections, for easy sizing.
- Flexible to seal small to large openings in raised floors, even fitting around obstacles.
- Fire rated - UL94 HF1 flame retardant.

Before - Air Can Pass Underneath The Rack

After Installation Gap Eliminated
